
Question 1: Student Class

Create a Student class with:

- Name and 3 marks (like mark1, mark2, mark3)

Methods:

- total() → Return total of 3 marks
- average() → Return average mark
- isPass() → Return True if average ≥ 50

Write the constructor and call all implemented methods in the main function.

Question 2: Vehicle Maintenance Cost Tracker

Context:

A transport company wants to track maintenance costs for different vehicle types:

- Car
- Truck
- Motorbike
- Bus

Common Attributes:

- Vehicle ID
- Brand
- Year of Manufacture
- Mileage
- Base Maintenance Cost

Cost Calculation Rules:

- Car: Cost = Base Cost + Mileage $\times 1.2$
- Truck: Cost = Base Cost + Load Weight $\times 500$
- Motorbike: Cost = Base Cost + (Mileage / 10) $\times 50$
- Bus: Cost = Base Cost + Number of Seats $\times 200$

Tasks:

1. Input a list of N vehicles (must enter at least 4 records, and the types must be different — or can initialize the objects directly instead of inputting them from the keyboard).

2. Calculate and display the total maintenance cost.

3. Without including Base Cost for all, calculate the total cost of Motorbikes and Buses, then compare it with Cars to see which has the higher cost.
